

25W DC/DC CONVERTER

Industry's Fastest Settling

DC/DC Converter

US Patent 6,262,901 B1

Key Features

- 25 μ S transient response
- Efficiency up to 86%
- Wide input voltage range (2:1)
- Soft start
- Single/Dual/Triple
- Short circuit protection
- Adjustable output
- 75 μ A off state current
- Synchronization
- Six-sided shielding
- Industry pinout
- Input under & overvoltage protection
- Output overvoltage protection
- Thermal protection

Beta Dyne is protected under various patents, including but not limited to U.S. Patent numbers: 5,777,519; 6,188,276; 6,262,901; 6,452,818; 6,473,3171.

Functional Description

The 25W series is a family of high-performance and high power density, isolated DC/DC converters consisting of single, dual and triple output models. State-of-the-art design and packaging techniques make possible the 20W/in³ power density without sacrificing functionality or performance. The 25 μ S transient response time makes these modules ideal for fast-switching load applications and the 75 μ A off-state current drastically reduces the current drain in battery-operated systems.

¹ ⚠ WARNING - Usage of input fuse with adequate ratings is essential to avoid possible hazard and damage of the unit. A suppressor diode with adequate ratings is intended to be connected in series to the supply for reverse polarity protection.

² Contact factory for -55° to +85°C operating temperature range.

³ The maximum input current at any given input range measured at minimum input voltage is given as 1.6*I_{NOMINAL}. Nominal input current is the typical value measured at the input of the converter under full-load room temperature and nominal input voltage (12, 24 and 48Vin).

⁴ Adequate insulation is to be provided to the converters at the end usage as per applicable requirements.

⁵ Temperature rise on the case of the converters is to be considered during the end usage as per applicable requirements.

EXTERNAL SYNCHRONIZATION

The converter can be synchronized to an external clock by driving the SYNC pin (pin 2) directly or with an open collector-open drain (1 TTL load). The driving signal frequency must be 320kHz ±5% (20% low, 80% high duty cycle). The PWM used in the 25W

series offers bidirectional SYNC ports, which allow multiple unit synchronization by connecting all SYNC pins together. In the absence of an external clock, the faster unit takes control of the SYNC bus and the rest of the units follow.

EXTERNAL TRIMMING OF OUTPUT VOLTAGES

To trim the output voltage DOWN, connect a 5% ¼W resistor between the + (plus) output and trim pins of the converter. To trim the output voltage UP, connect a 5% ¼W resistor between the – (minus) output and trim pin of the converter. For UP/DOWN trimming capability, connect a 10kΩ potentiometer between the + and – pins, with the wiper arm connected to the trim pin. The trim resistors/potentiometer can be connected at the converter output pins or the load. However, if connected at the load, the resistance

of the runs becomes part of the feedback network, improving load regulation. If the load is some distance from the converter, the use of #20 gauge wire is recommended to avoid excessive voltage drop due to the resistance of the circuit paths.
