OUTPUT VOLTAGE ADJUSTMENT

For both single and dual models, the output reference voltage is referenced to the output ground: Pin 6 for singles and Pin 8 for duals. To trim the output voltage high, connect a 1% resistor (0k Ω –200k Ω range) between $-V_{OUT}$ (Pin 6) and V_{OUT} Adjust (Pin 9) for the singles, and COM (Pin 8) and V_{OUT} Adjust (Pin 5) for the duals. To trim the output voltage low, connect a 1% resistor (50k Ω –500k Ω range) between $+V_{OUT}$ (Pin 5) and V_{OUT} Adjust (Pin 9) for the singles,

With the wiper connected to the V_{OUT} Adjust pin, a variable resistor (potentiometer) can also be used for V_{OUT} adjustment by connecting each end to $+V_{OUT}$ and $-V_{OUT}$ for the singles, and $+V_{OUT}$ and COM for the duals. A potentiometer between 50k Ω –100k Ω can be used. Avoid using a low resistance potentiometer or a high temperature coefficient such as wound wire.

EXTERNAL SYNCHRONIZATION

This series of converters can be synchronized to an external system clock of 320kHz -2% to 10%. The external clock is AC-coupled to the input SYNC terminal (Pin 2) through a coupling capacitor

from 220pF to 1000pF. The required amplitude is 3.3V to 5V and its duty cycle is 50% $\pm$ 20%. Please refer to *Application Note DC-005: Synchronization* for more information.
